

# **AutoCAD Level 2**

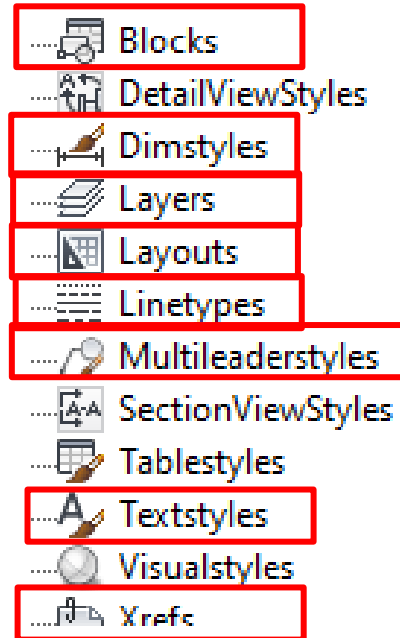

## **Session 07**

# AGENDA

- Design Centre
- Template Files
- Source Files

# Design Center

- Design Center gives you the ability to transfer existing elements of a drawing from one file to another. For instance :

- The true power of AutoCAD is once again being revealed. Never having to draw the same thing twice or in this case **Never having to set up the same thing twice.**

# Template Files

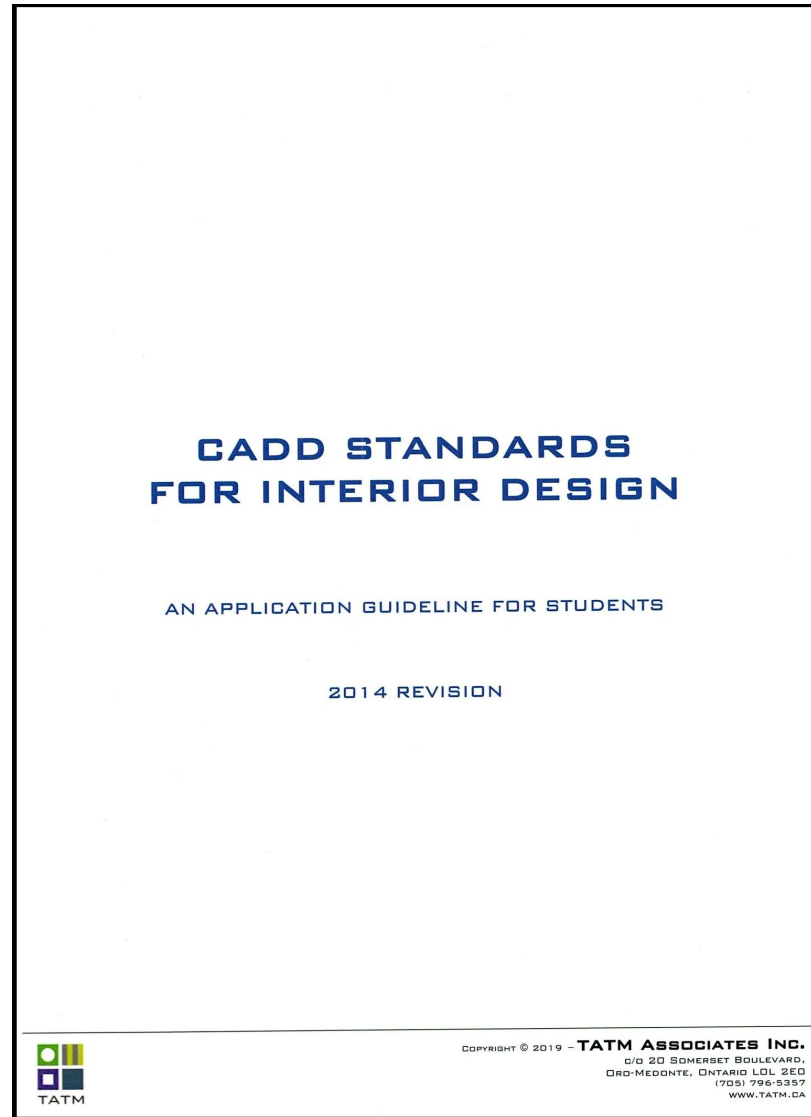

- So in previous sessions we've talked about utilizing template files that had certain setup procedures already done, for instance layers.
- In the past 4 or 5 sessions, we have created quite a bit of formatted items such as text, dimensioning, blocks, and layouts.
- We should now revisit creating new templates with more items involved.

# Source Files

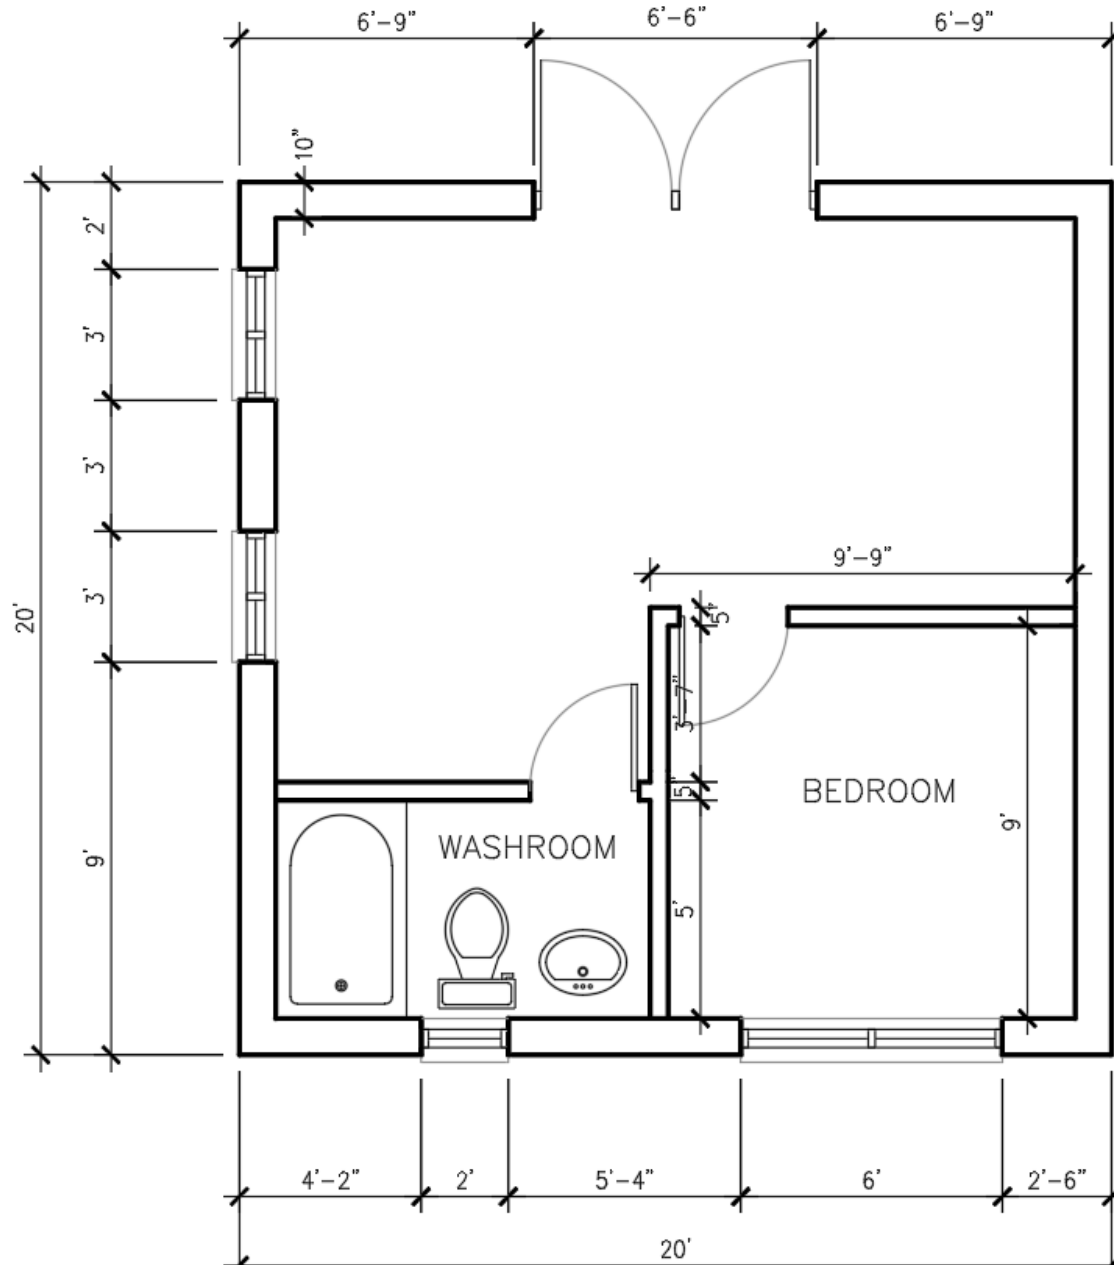

- One can develop a source file that is equipped with AutoCAD elements of your liking such as layers, text styles, Dimension styles, blocks, layouts, multileader styles.
- These elements will then be saved under one file for your future use
- One can continuously add to this source file

# Cadd Standards for Designers

- Canadian publication

# Exercise 13

Now that you have your template and source file set up for architectural drawings, create the following floor plan using your template and your source file to speed up your work production.

Include Door tags and window tags

Place on an 17x11 papersize with a titleblock
